PLANT DETAILS

Agave montana

MOUNTAIN AGAVE

These are squatty, wide green leafed, rounded Agaves with distinctive and prominent upward and downward curved sharp marginal teeth and a sharp 1 in. long terminal spine. They are solitary plants that grow in habitat up in the higher mountainous mixed pine forests of the Sierra Madre Oriental, hence, their common name. Some Mountain Agaves can tolerate low temperatures in the single digits, but we recommend zone 8 and warmer. As with other Chihuahuan Agaves, these plants will benefit from being planted in morning to filtered mid-day sun, with little to no late afternoon sun in low desert gardens. In upland or coastal locations they do well with full sun and minimal, but regular summer watering. Their adaptability, cold hardiness, attractive bud imprints and symmetrical shape make them a wise choice for many landscape designs.
