Agave victoriae-reginae

QUEEN VICTORIA AGAVE

These Chihuahuan desert native agaves form distinctive, tight ball-shaped rosettes with short, thick, and rigid triangular toothless leaves of dark green with white bud imprint on upper and lower leaf surfaces. They look like an artichoke. Each leaf does have a short, sharp terminal spine, but they are mostly smooth as Agaves goes. They are slow growing but dependable in well-drained soils for full sun to part sun locations. They work well in containers, planted in masses, or simply mixed with other desert accents or perennials.
