

Pedilanthus macrocarpus

LADY SLIPPER

Lady slipper, or Slipper plants grow from a basal clump forming many bright chartreuse colored verticals, snaking stems. In late summer to fall, the stems are topped with bright orange blooms that have the appearance of a lady's slipper, hence the common name. They tolerate heat and drought, but the stems are sensitive to scorch or sunburn from intense western sun or reflected heat. They are not particular of soil type, but do require well-draining soils. Require little to no maintenance during the year. They are popular as wild-looking accent plants for minimalistic mass plantings. Note that they do exude a white milky sap that can be a skin irritation for some, so take care to use gloves when pruning.

DESCRIPTION	
	3-4 FT. HIGH & WIDE
	FULL TO PART SUN
	9-11
	MEXICO
	ORANGE
	LOW
	TO 25°F
