

Acacia aneura

MULGA

Dominant tree of Australian scrub ecoregions. Like Palo Verde or Mesquite of our Sonoran Desert. They have distinctive short, narrow gray leaves and are relatively slow growing. Bright yellow catkin-like flowers appear starting in fall, followed by dark brown flattened seed pods in spring. They require very little maintenance such as annual thinning or pruning for shape and structure, along with minimal leaf, or seed pod clean up. Regular deep waterings during the hottest summer months are beneficial, with limited water during coldest months. Flowers are short golden catkins, that look like puffed Cheetos, which are followed by dark brown papery seed pods that linger for a time before blowing off. Tough, tolerant, and reliable trees.
