

Aloe ferox

CAPE ALOE

This is an arborescent Aloe that will form stout trunks that elevate the bold, spiny foliage. They produce wide, tapering leaves armed with small, sharp teeth on the margins and leaf surfaces for protection. Fall to winter blooming, they form dramatic, multi-branched, candelabra type stalks that are densely covered with dark, burnt orange tubular flowers. They are long blooming with flowers opening from the bottom of the stalk first. Cape Aloes are resistant to cold compared to other Aloes. As with other Aloes, they require well-drained soils and can be planted in full to part sun. A period of acclimation is needed for locations with the hottest western sun.

DESCRIPTION	
	6-8 FT. HIGH X 3-4 FT. WIDE
	FULL TO PART SUN
	9-11
	SOUTH AFRICA
	DARK ORANGE
	LOW
	TO 20°F
