PLANT DETAILS

# Aloe x 'Hercules' Tree Aloe

HERCULES TREE ALOE

These fantastic, fast growing tree aloes are a hybrid cross between two other tree aloes, *A. barbara*e (Syn. *A. bainesii*) and *A. dichotoma*. The resulting offspring takes on the best characteristics of both parent aloes, tolerating wide range of conditions and exposure to sun and heat. As they mature, they develop thick trunks with attractive peeling bark to reveal smooth to fissured, silvery-looking skin. Their leaves are a long, straight dark green triangular shape, tapering to a point. Due to their commanding size and bodacious form these aloes are best used as single dramatic specimens or planted en masse for large-scale projects that demand attention. Plant in well-drained soil.
