# Baileya multiradiata

## DESERT MARIGOLD

Reliable reoccurring color. These are true ephemerals living fast and furious to bloom then cast more seed to perpetuate their existence. Compact clumps of gray pubescent foliage sprout stems topped with bright yellow daisy-like blooms from spring into summer. Cut plants back completely as flowers fade. In well-drained soils Desert Marigold are quite persistent plants, although young plants can be tender to transplant, so manage them with care. These naturally occurring, tough low-water use plants are adaptable up to 5000 ft. but if mother plants freeze out, not to worry, spring weather will bring new seedlings. Complimentary flowering perennials for virtually all low desert landscape situations.
