

Echinocactus grusonii

GOLDEN BARREL

These handsome golden-spine ball-shaped cacti are native to SE Mexico. They have a massive water storage capacity with the ribs becoming shallow and wider apart as the plants absorb more water. The curving, firm sharp spines are held along the ribs from the bottom becoming more numerous toward the top of the plants. Yellow camouflaged but attractive blooms form in a ringed pattern at the top of the plant in spring. These are adaptable, easy to grow sculptural plants popular with winter visitors to the low deserts. With age they have the capacity to produce offsets and multiply into large multi-clustered specimens that are quite stunning. Well-drained soils with light watering only during warmer months. Golden barrels are offered in many container sizes and as easy-to-handle field grown individual bareroot plants and clusters. Please call our sales team for details and current availability.

DESCRIPTION	
	1-3 FT. x 1-4 FT.
	FULL TO PART SUN
	USDA ZONE 9-12
	MEXICO
