PLANT DETAILS

Euphorbia rigida

GOPHER PLANT

These shrubby, but succulent plants are comprised of multiple low to sprawling stems with whorled pointed foliage. Typically grow to 2 ft. tall and spread in a rounded fashion to about 3 ft. wide. During spring, each branch will form a sizeable umbel of pea-sized, yellow flowers surrounded by bright chartreuse colored bracts. Often, from the weight of these blooms the stems bend downward, but they still maintain a shrubby appearance. They are adaptable, extremely heat tolerant and lower water use. Well-drained soil is a must to help them thrive. Blooming can sap their strength and some branch die-back can occur, which is normal. Refresh the entire plant by pruning all stems back to the ground, and new stems with fresh foliage will sprout and grow back quickly.

DESCRIPTION

 4-8 FT. HIGH X 3-5 FT. WIDE

 FULL TO PART SUN

 7-10

 MEDITERRANEAN

 YELLOW/CHARTREUSE

 MODERATE TO LOW

 TO 10°F
