

Fortunella obovata 'Fukushu' Kumquat

FUKUSHU OR CHANGSHOU KUMQUAT

Kumquat trees are small ornamental trees that produce edible citrus-like fruits that are typically eaten whole. This variety has larger bright green leaves, and larger juicier, slightly pear-shaped fruits than most other types. Once mature, they usually produce flowers from May to Sept. with fruit bearing throughout the year. Due to their size and reliability to bear, they are prized for growing in large containers. Use them anywhere a fragrant flowering small tree is desirable, such as poolside, patio, or courtyard. Easy to care for citrus, quite cold tolerant, with average water and maintenance needs.
