

# Lonicera japonica

HALL'S HONEYSUCKLE, JAPANESE HONEYSUCKLE

*Sturdy, woody perennial fragrant flowering vine.* For utility and durability this vine cannot be beaten. In wetter parts of the country, these vines are considered noxious weeds. In our arid climate they have little to no self-spreading tendencies. Woody, gray stems are covered with round to oval, dark green pubescent leaves. Strongly fragrant white to creamy yellow tubular flowers are borne in clusters during spring. These vines are semi-deciduous in low deserts but can lose leaves completely in colder zones, but are cold hardy to -20°F. As a vine they need support to climb. A trellis, chain-link, arbors or tripods. As a groundcover they will sprawl along the ground, but will root in where they touch the ground at nodes along the stems where soil is moist.
