

Pachycereus marginatus

(Syn. Stenocereus marginatus)

MEXICAN FENCEPOST

These are large growing columnar growing cacti that form numerous, thick vertical stems from the base. In optimal conditions they can grow rapidly, compared to other cacti species. They have squarish stems typically 5-7 in. wide with the similar number of ribs. The rib margins are lined with conjoined, bright white areoles with short bristle-like spines, that can vary by length. They have striking lines and verticality that make designers and cacti aficionados' drool. Plant in well-drained soils with room to grow.
