

Yucca gloriosa

SPANISH DAGGER

Spiked, dramatic foliage on multiple trunks. This is a moderate to fast growing arborescent yucca that performs best with protection from hottest western exposures in low deserts. Leaves are flat, bright green sword shaped with no sharp terminal spine, which makes them ideal for pool and patio areas. Native to southeastern U.S., they do not mind the heat, and they will accept more water, with less sun, if the soil is well-drained. These lush, tropical looking plants do well in large pots or as specimens in entryways or blended with other tropical foliage shrubs, perennials, or palms. In too much late afternoon sun, the leaves can yellow and become scorched. Acclimating them to full sun is possible but takes some time.
