

Yucca rostrata

BEAKED YUCCA

These are moderate to fast growing arborescent yuccas that eventually form multiple heads, although plenty as single head specimens. The leaves are soft, narrow, silver blue that form a symmetrical round head of leaves about 4 ft. across. The narrow 1/2 in. wide, 2-3 ft. long blue leaves gently flutter with even a slight breeze. The leaves are armed with a slight terminal spine but due to their pliability they are not overly dangerous. These yuccas are accommodating to different soil types and moisture levels, but generally good drainage is recommended. They flower like other yuccas with woody stalks that stand 3-4 ft. above the foliage in spring to summer. Stalks are branched candelabra form from which hang big, white bell-shaped flowers that bees and other pollinators adore. Use them in mass plantings, as single specimens, around pools, patios, any landscape that requires or desires the nobility of a true queen.
