

Muhlenbergia rigens

DEER GRASS

Green soft mounding perennial ornamental grass. This true AZ native occurs around 2500 to 7000 ft. in elevation usually associated with drainages, riparian areas or as understory plants with various pine and juniper species. They form a naturally soft rounded mound of evergreen foliage. When in bloom, multiple tight vertical flower/seed stalks appear to make it look like a big pin cushion. Moderate moisture in low desert landscapes keeps them flush and fresh looking through the summer. As with all Muhly grasses, little to no maintenance is best, but trimming them to the ground in early spring just prior to new foliage growing back is best. Many practical landscape applications including for foundational plants, erosion control, oasis to desert transitions, containers or around patios or pools.
