

# Ficus pumila

## (Syn. Ficus repens)

### CREeping FIG

Ficus pumila is a vigorous and fast-growing evergreen climber. It's commonly known as the creeping fig or climbing fig. An easy-care solution for an unsightly fence or wall to deliver a fast wall of emerald green with proper care. Also looks great spilling out from patio pots. Bushy and woody with small, shiny, ovate or heart-shaped leaves that mature into large, thick leaves. Regular pruning will keep it to a manageable 8-12 feet tall and 3 feet wide. Needs partial to full sun. Water deeply when the soil is dry. Prune the mature foliage to promote new young growth. It will not tolerate frost, needs to be above 34 degrees to thrive. Be careful because it can also become invasive and its secondary roots or tendrils can cause structural damage to porous wall material. Small, purple fruits may appear throughout the year.
