

Agave Durangensis

ZACATECAS AGAVE

The common name is a nod to Zacatecas, Mexico and the species name indicates the broader region where these sturdy and sculptural Agaves originate from. “Durangensis” means “from Durango” and refers to the native distribution of the species in Durango, Mexico. Deep guttered, vertical leaves of gray-green growing from a thick rosette, helps identify this Agave. Adding to its dramatic appearance, they have numerous, large marginal teeth that create an outstanding bud imprint on the leaf surfaces with leaves tipped by a strong, nearly black terminal spike. The rosettes grow to 6 feet in diameter, usually solitary or offsetting sparingly. Leaves are up to 3 feet long. Provide them with well-drained, or granite-laden soils and some extra water during the growing season to keep these handsome Agaves happy.

DESCRIPTION	
	3-4 FT. x 4-6 FT.
	FULL SUN
	USDA ZONE 9-12
	CENTRAL MEXICO
	GREEN/YELLOW
	LOW
	TO 25°F
