PLANT DETAILS

# Aloe Striata

## CORAL ALOE

The Aloe Striata is a captivating succulent that adds a burst of vibrant color to any landscape. It grows to a medium-sized rosette composed of leaves that vary in color, depending on the amount of sun it receives. In full hot sun, the leaves will be pinkish, in more shaded spots they will be bluish-green. 'Striata' is from the Latin 'striatum' meaning "grooved" or "striped," in reference to the dark narrow lines on the leaves. In late winter into early spring, 2-foot-tall branched stems put on a show of coral-red flower clusters. In our lower desert, the striata will perform best in partial sun/light shade in well-drained soil. Heat and drought-tolerant. Plant as a solitary specimen or en masse in the xeriscape garden. Also good for containers. Watch it take on a mesmerizing translucent quality as it captures the sunlight.
