

Aptenia Cordifolia

HEART LEAF ICE PLANT/ BABY SUN ROSE

A super-hardy, ice plant-like groundcover. Unlike most ice plants, these plants have larger succulent heart-shaped bright green leaves. They are a reliable long-blooming ground cover that forms star-shaped iridescent pink to red flowers during spring through summer. The flowers open during the bright part of the day from noon to the afternoon. This ice plant relative is extremely drought and heat tolerant, but it performs best with some afternoon shade in low deserts. Useful for erosion control, spilling over on sunny slopes, around boulders, or other hardscape elements where few other plants will thrive. Also nice under large shrubs or evergreen trees, as well as in hanging baskets and containers.

DESCRIPTION	
	2-3 FT. x 6 IN.
	FULL SUN
