

# Sansevieria cylindrica

## AFRICAN SPEAR

The “African Spear” has similar growing conditions as its succulent cousin, the Snake Plant. However, this sansevieria brings rounded, variegated dark green, tube-like leaves. Designers utilize these unique vertical strokes to contrast against leafier plant foliage in modern landscapes. A striking succulent originally from Angola, Africa, it can grow 7 feet tall. Creeping rhizomes under the soil can slowly create a dense grouping, if space allows. Plant in part to full sun, avoiding the hot afternoon sun. The leaves will not grow as tall or thick in shady conditions. Extremely drought tolerant in the growing season. Over watering will cause root rot. The cylindrica makes a dramatic statement in a landscape or indoors as a potted specimen. An engaging current houseplant trend is to braid the leaves when the plants are young.

| DESCRIPTION   |                  |
|---|------------------|
|  | 2 FT. x 6 FT.    |
|  | FULL TO PART SUN |
